

Package: ccostr (via r-universe)

October 25, 2024

Type Package

Title ccostr - Estimation of mean costs in censored data

Version 0.1.0

Description This package implements various estimators for inferring the mean censored cost data.

ccmean*Calculates estimates of the mean cost with censored data*

Description

This function calculates the mean cost for right-censored cost data over a period of L time units (days, months, years,...)

Usage

```
ccmean(x, L = max(x$surv), addInterPol = 0)
```

Arguments

- | | |
|-------------|--|
| x | A dataframe with columns: id, cost, delta and surv. If Cost history is available it can be specified by: start and stop, |
| L | Limit. Mean cost is calculated up till L, if not specified L = max(surv) |
| addInterPol | This parameter affects the interpolation of cost between two observed times. Defaults to zero. |

Details

The function returns four estimates. The first two are simple and biased downwards, and included for comparison. The estimates are:

- AS: "Available Sample estimator" - The simple sample mean
- CC: "Complete Case estimator" - The mean of fully observed cases
- BT: "Weighted Complete Case estimator" - Bang and Tsiatis's estimator
- ZT: "Weighted Available estimator" - Zhao and Tian's estimator

The function needs the following in a dataframe:

- id: The id separating each individual
- cost: The total cost, or if start and stop provided the specific cost
- start: Start of cost
- stop: End of cost, if one time cost then start = stop
- delta: Event variable, 1 = event, 0 = no event
- surv: Survival

Value

An object of class "ccobject".

Examples

```
hcost  
ccmean(hcost, L = 1461, addInterPol = 1)
```

hcost

Simulated data from the stata hcost package

Description

Simulated data from the stata hcost package

Usage

```
data(hcost)
```

Format

An object of Rdata

Examples

```
data(hcost)
```

plot.ccobject *Adding to the generic plot function*

Description

Adding to the generic plot function

Usage

```
## S3 method for class 'ccobject'  
plot(x, ...)
```

Arguments

x	The ccobject
...	passthrough

Value

a plot

print.ccobject *Adding to the generic print function*

Description

Adding to the generic print function

Usage

```
## S3 method for class 'ccobject'  
print(x, ...)
```

Arguments

x	The ccobject
...	passthrough

Value

a plot

simCostData	<i>Simulates censored cost data</i>
-------------	-------------------------------------

Description

This function can be used to demonstrate the bias and coverage of the estimators in the ccmean function

Usage

```
simCostData(n = 100, dist = "unif", censor = "light",
            cdist = "exp", L = 10)
```

Arguments

n	Number of individuals to simulate
dist	Survival distribution either "unif" = unif(0,10) or "exp" = exp (1/6)
censor	Censoring "light" ~ 25% or "heavy" ~ 40%, changes a bit depending on cdist
cdist	Distribution used to censor, "exp" exponential or "unif" uniform
L	Number of years to summarize over

Details

The function simulates survival times from either an uniform distribution or an exponential distribution, and a cost history. There are two options for censoring, heavy (~40 light (~25

Value

Simulation of censored cost
